DECLARATION

Date: March 2026 Place: Mathura

This is to certify that the Bachelors of Technology project entitled "AI-HealthGuard: An AI-based ischemic heart disease risk prediction and prevention system" has been completed in partial fulfillment of the requirements for the degree of Bachelors of Technology in Computer Science and Engineering at the Department of Computer Science and Engineering of GL Bajaj Group of Institutions, NH-2, Mathura-Delhi Road, P.O. Akbarpur, Mathura-281001(U.P.). The project was executed between July 2025 and March 2026 under the direction of Er. Ankit Pachouri, Assistant Professor.

The project report is the original record of the author, and has not been submitted as a basis for another degree at a different institution. The project report is free from any form of plagiarism.

Tarun Kumar	Sakshi Rajput	Prashant Prajapati

CERTIFICATE

This is to declare that Mr. Tarun Kumar (Roll No. 2205111530052), Ms. Sakshi Rajput (Roll No. 2205111530046) and Mr. Prashant Prajapati (Roll No. 2205111530036), have contributed to the development of a technical solution called "AI-HealthGuard", to assist in evaluating risk factors and preventing ischemic heart disease. In partial fulfillment of the requirements for the award of a Bachelor of Technology degree (Computer Science and Engineering) they are providing you with this report as documentation for their original work. To my knowledge this is an original project, has not been submitted for any other degree and is eligible under the terms of copyright law.

ACKNOWLEDGEMENT

We would like to express our appreciation to Er.Ankit Pachouri, Assistant Professor, Computer Science and Engineering Department, GL Bajaj Group of Institutions, Mathura for his assistance, encouragement and guidance during this project. He has provided much-needed support, direction and feedback throughout the duration of the project as well as valuable technical knowledge.

Also, we would like to express our sincere appreciation to the Head of the Department, Computer Science and Engineering Department, GL Bajaj Group of Institutions for providing the necessary laboratory and physical infrastructure needed for conducting the research and to the open source development community for contributing their time and expertise to developing the tools used on this project such as scikit-learn, XGBoost, SHAP, Streamlit, TensorFlow and Pandas helping to make the research possible.

Finally, we would like to thank the UCI Machine Learning Repository for making available the Cleveland Heart Disease Dataset in the public domain. We would also like to thank our families and friends for their continued support and moral encouragement throughout this project.

Tarun Kumar (2205111530052)
Sakshi Rajput (2205111530046)
Prashant Prajapati (2205111530036)

ABSTRACT

Ischemic Heart Disease (IHD) is a worldwide epidemic responsible for an estimated nine million deaths globally, making it the most common cause of death globally, accounting for approximately 13% of overall global mortality. IHD can be prevented by early identification of risk factors and providing appropriate lifestyle interventions. Diagnostic techniques used today, such as cardiac catheterization and angiography, prove to be costly, invasive, and too far out of reach for many families and individuals who are middle-class and/or reside in rural areas.

Furthermore, current clinical risk calculators such as GRACE and Framingham rely on linear statistical data models that do not adequately represent the complex, non-linear interactions between risk factors nor do they present any explanations of how they came to the prediction contained within their output. The goal of this project is to create an AI-driven web application called AI-HealthGuard that will allow patients to predict their own risk of developing IHD and to receive recommendations regarding preventive health care at no cost to the patient or user of the system.

Specifically, AI - HealthGuard will use 13 different routine, clinically-relevant parameter measurements that have previously been established from the UCI Cleveland Heart Disease Dataset database. Five different types of classification models (Logistic Regression, Random Forest, XGBoost, Support Vector Machine (SVM) and Neural Network) will be used to predict an individual's IHD risk as binary data.

The classification model that was selected as the primary classifier and the model that will be promoted throughout this project is the XGBoost, with a target accuracy of 90% or greater and AUC of 0.90 or greater. All models will be optimized for performance using GridSearchCV, with a 5-fold cross-validation and trained on an aggregated data set containing imputed data, OneHotEncoding, StandardScaler normalization of the dataset

and SMOTE oversampling. The provision of an Explainable AI feature is also a major contribution of AI-HealthGuard.

The Explainable AI feature will use SHAP (Shapley Additive Explanations) to generate per-individual model output prediction feature importance visualizations and non-technical, plain English explanatory content for each individual, based upon their unique set of data entry points. Furthermore, an individual's Composite IHD Risk Score (0-100) will be calculated and subsequently used to generate a personalized prevention report detailing prevention actions in four categories (diet, exercise/lifestyle, referrals, etc.) that can be exported to a PDF for download, which will be presented to the user through the web dashboard generated by Streamlit.

Keywords: Ischemic Heart Disease, Machine Learning, XGBoost, SHAP, Explainable AI, Streamlit, UCI Cleveland Dataset, Preventive Healthcare, Risk Prediction.

CHAPTER 1
INTRODUCTION

1.1. Introduction to the Project

The number one killer worldwide is due to CVD or cardiovascular disease, the most lethal form of which is ischemic heart disease (IHD) also known as coronary artery disease (CAD). According to WHO stats from 2019, an estimated 18 million people died from CVD representing 32% of total death worldwide. About 9 million annual deaths (IHD alone) account for about 13% of total global mortality.

Ischaemic heart disease has a heavy disease burden yet is preventable. It has a long asymptomatic progression, usually in an unobtrusive manner until it manifests as a fatal cardiac complication after several years. Typical diagnostic tools like angiography, cardiac catheterisation, etc are costly, invasive and require specialized facilities that do not exist in the home, primary care or the rural community. Traditional risk assessments (e.g., those based on the Framingham, GRACE, and TIMI studies) use linear statistical analyses that fail to establish the complex non-linear relationships between risk factors and only produce a basic yes/no answer without any supporting rationale.

The new technologies of Machine Learning (ML) and Explainable Artificial Intelligence (xAI) can provide very strong alternatives to current methods for identifying medical errors. For example, ML models that are trained using curated databases of clinical data can be used to identify very complicated relationships between 13 standard health-related indicators of health (which can be obtained at the time of a general doctor's office visit) and be able to make predictions with greater than 90% accuracy. AI-HealthGuard creates a zero-cost web application that provides these capabilities without having to buy expensive equipment to do so.

1.2. Objectives and Scopes

1.2.2. Objectives

- Create and evaluate five Machine Learning (ML) algorithms for predicting the binary status of patients with ischaemic heart disease (IHD): Logistic Regression, Random Forest, Extreme Gradient Boosting (XGBoost), Support Vector Machines (SVM), and Neural Networks.
- Conduct extensive data preprocessing to include: imputation of missing records; standardization of continuous variable values using StandardScaler; one-hot encoding for categorical variables; and using the SMOTE method to modify the distribution of continuous variables to increase the number of individuals in the lower frequency IHD group.
- Select ten of the most predictive features to use in your models using feature selection techniques (ANOVA, Chi-square, and Mutual Information).
- You will also need to meet an accuracy of at least 90%, an area under the curve (AUC) of at least 0.90, and a F1-score of at least 0.88 as established from prior research.
- Generate SHAP Explainable Artificial Intelligence (AI) to rank the importance of each feature per prediction and produce global Violin plots.
- Generate a composite score of IHD risk (0 to 100) for each patient and generate individualized IHD Prevention Reports for each patient.
- Develop a web-based dashboard that is built using Streamlit and allows for the downloading of a PDF version, so patients will be able to access the information within their personalized reports easily, regardless of their computer skill level.
- Evaluate your models using metrics that include: accuracy; precision; recall; F1 score; AUC – ROC; calibration curves; and decision curve analysis (DCA).

1.2.2. Scope - Inclusions and Exclusions

In-scope system features: classification of IHD into 2 classes (binary) from UCI's Cleveland data set (303 samples) using 5 different machine learning models, create SHAP explainability for predictions, provide risk score dashboard, provide a way to

proactively manage patient health, and deploy using Streamlit. The out-of-scope system features: providing a clinical diagnosis, providing ECG waveform analysis, interfacing with an EHR system, creating a multi-disease prediction tool, creating a mobile application, and collecting real (actual, clinical) patient data.

1.3. Motivation

There is an imminent crisis in cardiovascular disease in India, with estimates that well over 54 million individuals living with coronary artery disease are at risk and that the vast majority are unable to access affordable preventative screenings.

The development of a zero-cost, browser-based, AI-powered tool that uses only very basic health metrics will make awareness of IHD risk accessible to individuals who live in Tier-2 and Tier-3 cities, semi-urban towns, and rural areas in India.

In this instance, the project will allow access for the team to construct an end-to-end machine learning pipeline (that is, preprocessing data, training the model, using SHAP for explainability, and deploying it on the web) in a clinically relevant environment.

1.4. Organization of Project Report

This research project began with a literature review consisting of five peer-reviewed articles, which are described in Chapter 2. System design, architecture, and module specifications will be discussed in Chapter 3. Chapter 4 describes the experimentation setup, implementation, and testing & Chapter 5 presents the entire source code of the entire project. Finally, Chapter 6 summarizes the results of this research study, provides analysis and conclusion of the findings, and discusses the contributions of each team member.

CHAPTER 2
LITERATURE REVIEW

2.1. Overview

Five peer-reviewed publications (2022 to 2025) have provided the research basis for AI-HealthGuard, which includes studies involving ML algorithms, datasets, preprocessing techniques, and evaluation methods to predict IHD. These studies help to inform the model selected, feature engineering, and evaluation methods used within this project.

#	Paper & Authors	Best Algorithm	Accuracy / AUC	Key Contribution Adopted
1	Chang et al. (2022) — AI Model for Heart Disease Detection, Healthcare Analytics	Random Forest	83% / ~0.82	Python RF pipeline; UCI dataset benchmark baseline
2	El-Sofany et al. (2024) — Predicting Heart Disease with ML & XAI, Scientific Reports	XGBoost + SMOTE	97.57% / 0.98	SF-2 feature subset; SMOTE; SHAP; 10-classifier comparison
3	Alshraideh et al. (2024) — Heart Attack Prediction, Applied Computational Intelligence	SVM + PSO	94.3% / 0.896	Feature selection via PSO; 10-fold cross-validation
4	Bani Hani & Ahmad (2023) — ML for IHD: Systematic Review, Current Cardiology Reviews	XGBoost (97.7%)	AUC 0.99 / 0.96	PRISMA-based model comparison; supervised vs unsupervised
5	Vu et al. (2025) — ML for Coronary Heart Disease, JMIR Cardio (Suita Study)	Random Forest	0.73 / 0.73	SHAP dependency plots; calibration curves; DCA

Table 1: Literature Review Summary

2.1.1. CHENG ET. AL (2022)

The research findings from Chang et al. (2022), El-Sofany et al. (2024), Alshraideh et al. (2024), Bani Hani and Ahmad (2023), and Vu et al. (2025) are summarized below: CHANG ET AL. (2022) Chang et al. (2022) used the UCI Cleveland dataset to create a Random Forest pipeline with training accuracy of 83% and test accuracy of approximately 82%, establishing the Random Forest (RF) baseline for AI-HealthGuard and serving as the benchmark for Logistic Regression comparison.

2.1.2. EL-SOFANY ET AL. (2024)

El-Sofany et al. (2024) published the most comparable study to AI-HealthGuard's, achieving 97.57% accuracy and area under the curve of AUC = 0.98 with an XGBoost classifier in combination with SMOTE on the Cleveland dataset. They introduced a feature subset framework: SF-1, SF-2, SF-3, where SF-2 (top 10 features based on ANOVA/Chi-square/Mutual Information) produced the best results on average. AI-HealthGuard closely follows this methodology by using XGBoost as its classifier.

2.1.3. ALSHRAIDEH ET AL. (2024)

Alshraideh et al. (2024) used a support vector machine (SVM) classifier with particle swarm optimization to select features, obtaining 94.3% accuracy and area under the curve of AUC = 0.896 in a 10-fold cross-validation. This study provides justification for including the SVM classifier in AI-HealthGuard and informs the Grid Search hyperparameter tuning approach.

2.1.4. BANI HANI AND AHMAD (2023)

Bani Hani and Ahmad (2023) conducted a systematic PRISMA review comparing ML Algorithms used to predict IHD on multiple datasets. In this study, the McGowan et al. study reported an area under the curve (AUC) of 0.99 for the XGboost algorithm compared to 0.96 for Catboost. These results provide evidence that ensemble classifiers, specifically boosting classifiers, consistently outperform single classifiers, providing motivation for the multi-model ensemble approach of AI-HealthGuard.

2.1.5. VU ET AL. (2025)

Vu et al. (2025) showed the applicability of using Random Forest on a large prospective cohort, the Suita study in Japan, by presenting the following findings: (1) dependence plots and (2) calibration curve and (3) Decision Curve Analysis (DCA) as evaluation methodology. AI-HealthGuard will utilize the calibration curves and DCA methods presented by the Vu et al. paper.

2.2. Synthesis and Gap Analysis

AI-HealthGuard employs four best practices that have been documented in the literature, namely: (1) XGBoost and Random Forest provide superior accuracy compared to any individual classifier; (2) SMOTE is critical for addressing class imbalance; (3) SHAP is the accepted method for interpreting the output produced by IHD classifiers; and (4) ANOVA/Chi-square/MI feature selection enables the generation of optimal subsets of features. AI-HealthGuard addresses the identified gap in the literature, i.e., the lack of a publicly available, integrated, interpretable, and household-level IHD prediction tool based on these four best practices, that is delivered via a single web-based dashboard and provides personalised prevention advice.

CHAPTER 3
DESIGN OF PROJECT MODELS

3.1. System Architecture - 6 Layers Pipeline

The Pipeline Architecture of AI-HealthGuard has six sequential and loosely connected levels. Each level has a clear Python function interface that allows each level to be replaced or upgraded without affecting any other level. The Inference pathway (Levels 4 to 6) is meant to complete with a response time of less than 3 seconds of run-time on minimum requirements hardware.

Layer	Name	Responsibility	Primary Module(s)
L1	Data Layer	Load and version-control raw CSV dataset	data_loader.py
L2	Preprocessing Layer	Imputation, encoding, SMOTE, feature selection	preprocessor.py
L3	Model Training Layer	Train, tune, evaluate, and serialise all five ML models	model_trainer.py, evaluator.py
L4	Inference Layer	Load serialised models; transform input; predict	inference_engine.py
L5	Explainability Layer	Compute SHAP values; generate local and global plots	explainer.py
L6	Presentation Layer	Streamlit UI — forms, gauges, charts, PDF export	app.py, recommender.py, risk_scorer.py

Table 2: 6 Layers Pipeline Architecture

3.2. Dataset Design

Attribute	Details
Source	UCI Machine Learning Repository — Cleveland Clinic Foundation
Total Samples	303
Input Features	13: age, sex, cp, trestbps, chol, fbs, restecg, thalach, exang, oldpeak, slope, ca, thal
Target Variable	condition: 0 = No IHD; 1–4 = IHD (binarised to 0/1)
Class Distribution	~54% No IHD (164), ~46% IHD (139) — corrected via SMOTE
Missing Values	ca (4 missing), thal (2 missing) — median/mode imputation
Train/Test Split	75% / 25% stratified

Table 3: UCI Cleveland Heart Disease Dataset Summary

3.3. Processing Pipeline Design

The following are the six ordered steps applied in sequence to mitigate data leakage:

- Step 1 - Missing Value Imputation using SimpleImputer (median for ca, mode for thal).
- Step 2 - Target Binarization (mapping condition values 1-4 to 1 for positively tested individuals).
- Step 3 - Categorical Encoding using OneHotEncoder with drop = 1 on cp, restecg, slope, and thal.
- Step 4 - Feature Selection using ANOVA F-value, Chi-square, and Mutual Information providing a SF-2 feature set of the top 10 features.
- Step 5 - Normalization using StandardScaler fitted only to the training data; StandardScaler transformation will then be applied to both datasets.
- Step 6 - SMOTE Oversampling applied only to the training fold, resulting in a 1:1 class ratio.

3.4. ML Model Design

- Logistic Regression (Baseline): Hyperparameters C have values of 0.01, 0.1, 1, 10, 100 and solver has values of liblinear and lbfgs.
- Random Forest (Ensemble): Number of estimators (n_estimators) can be set to 100, 200, or 300 and max_depth can be None, 5, or 10.
- XGBoost (Prim): Number of estimators (n_estimators) can be set to 100 or 200; max_depth can be 3, 5 or 7; learning rate can be 0.01, 0.1 or 0.3.
- SVM evaluates two variables: C has values of 0.1, 1, or 10 and each of the three kernels can use a different gamma (i.e., scale or auto).
- In a Neural Network (Deep) layer, the architectural configuration consists of a series of common layers (e.g., Dense(64, ReLU) → Dropout(0.3) → Dense(32, ReLU) → Dense(1, Sigmoid)), and specific libraries (e.g., Adam, binary_crossentropy).

Metric	LR	RF	XGB ★	SVM	NN
Target Accuracy	≥ 82%	≥ 88%	≥ 90%	≥ 86%	≥ 88%
Target AUC	≥ 0.82	≥ 0.88	≥ 0.90	≥ 0.86	≥ 0.88
Target F1	≥ 0.80	≥ 0.86	≥ 0.88	≥ 0.84	≥ 0.86

Table 4: ML Model Performance Targets (Benchmarks against Literature)

3.5. SHAP Explainability Design

AI-HealthGuard uses SHAP to provide solutions to the black-box issue. For each prediction made, there are 4 visualisation types created:

(1) SHAP Bar Chart — 10-most significant feature contributions displayed (these are displayed in red for increased risk, and in blue for being protective);

(2) SHAP Force Plot — a horizontal stacked bar that runs from the base probability to the output probability;

(3) Global Beeswarm Plot — the entire dataset, and its 10 most important features; and

(4) SHAP Dependency Plots — showing feature value versus SHAP value for the top 5 feature contributions. For technical details, TreeExplainer is used with Random Forest and XGBoost models; Kernel Explainer with SVM and Neural Networks (with a size of 50 samples used as a background).

A simple explanation is generated automatically for each prediction to assist non-technical users.

3.6. Risk Scoring and Prevention System

The IHD Risk Score can be calculated by multiplying the Prediction Probability by 100 and then rounding the result to the nearest whole number. There are 3 bands based on the calculated IHD Risk Score: Low Risk (0-39) continue preventative care, Moderate Risk (40-69) lifestyle modifications are needed and/or Lifestyle Modifications Required, and

High Risk (70-100) referral to a Cardiologist is required.

The Prevention Engine generates four categories of personalized recommendations; these are Dietary, Physical Activity, & Lifestyle Modifications & Medical. The full report can be exported in PDF format.

CHAPTER 4
EXPERIMENTS, SIMULATIONS AND TESTINGS

4.1. Methodology

The development of AI HealthGuard goes through five phases:

(1) Data Acquisition & Exploratory Data Analysis (EDA)

(2) Preprocessing

(3) Model Training & Hyperparameter Tuning

(4) Integration of SHAP Explainability and

(5) streamlit Dashboard Development.

Phase 1-4 is the offline training phase and produces serialized model artifacts saved as either file extensions (.pkl - for sklearn models or .h5 - for Keras NN) that the streamlit application will load into memory on start-up and enable prediction times of <3 seconds from the time of request without any real-time training data.

4.2. Hardware and Software Used

4.2.1. Hardware

- Development: Colab (T4 GPU — 12 GB RAM) to train models.
- An Intel i5 laptop (8 GB RAM) to develop Streamlit applications.
- To deploy Application minimum system: Intel i5 or similar, 8 GB RAM, modern browser.
- OS Interoperability: Windows 10/11 or Ubuntu 20.04+ or MacOS 12+.

4.2.2. Technology Stack

Category	Tool / Library	Version & Purpose
Language	Python	3.10 / 3.11 — Core language
Data Processing	pandas, NumPy	2.1.4, 1.26.4 — Data manipulation
ML Framework	scikit-learn	1.4.2 — LR, RF, SVM, preprocessing, metrics
Boosting	XGBoost	2.0.3 — Primary classification model
Deep Learning	TensorFlow/Keras	2.15.0 — Neural Network implementation
Class Balancing	imbalanced-learn	0.12.0 — SMOTE oversampling
Explainability	SHAP	0.44.1 — TreeExplainer, KernelExplainer, plots
Web Framework	Streamlit	1.34.0 — Interactive web dashboard
Visualisation	Plotly, Matplotlib, Seaborn	5.22.0, 3.8.4, 0.13.2 — Charts and plots
PDF Export	fpdf2	2.7.9 — Prevention report generation
Model Persistence	joblib	1.4.2 — .pkl serialisation for sklearn models
Dev Environment	Google Colab, GitHub	Notebook training (T4 GPU), version control

Table 5: Technology Stack Summary

4.3. Implementation - Google Colab Training Notebook

The AI_HealthGuard_Colab.ipynb file contains the complete training pipeline, which consists of seven cells: Install Dependencies, Data Loading and EDA, Preprocessing Pipeline, Model Training and GridSearchCV, SHAP Explainability Generation, FastAPI + ngrok API Server, and Built-in Streamlit UI. The file uses T4 GPU runtime to train a neural network in approximately 2 minutes total training time.

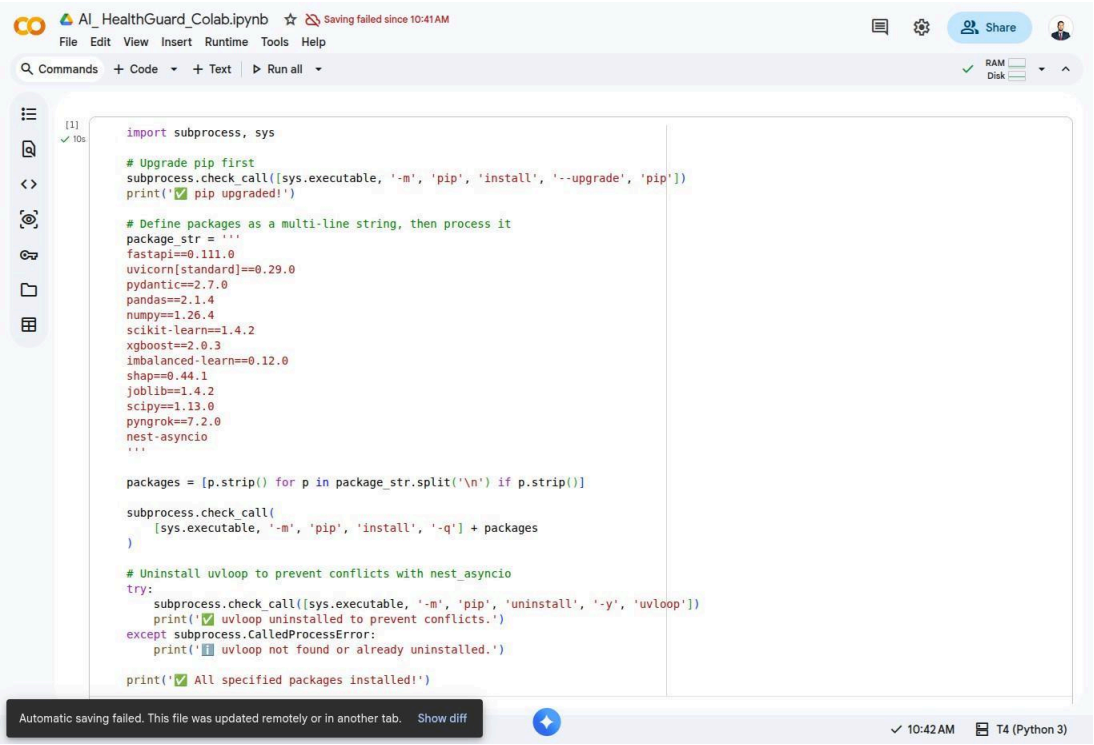

Fig. 1: AI-HealthGuard Google Colab Training Notebook (AI_HealthGuard_Colab.ipynb)

4.4. Implementation - Streamlit Web Dashboard

At layer 6 of the pipeline is the Streamlit application (app.py). This layer loads all five serialised models at the application start-up, combining into a dashboard with five tabbed views: Risk Assessment; AI Insights; Preventative Plan; Model Comparison; and Global Insights.

Figure 1 shows the Risk Assessment Dashboard. The left side panel allows for the acceptance of all thirteen clinical input variables using sliders and drop-down menu selections and provides tooltips with hints for ranges. The right side panel contains a circular gauge displaying the IHD Risk score (0-100) with colour coded bands (green = 0-39; amber = 40-69; red = 70-100), and also has a bar chart consisting of the Top Risk Drivers (using SHAP).

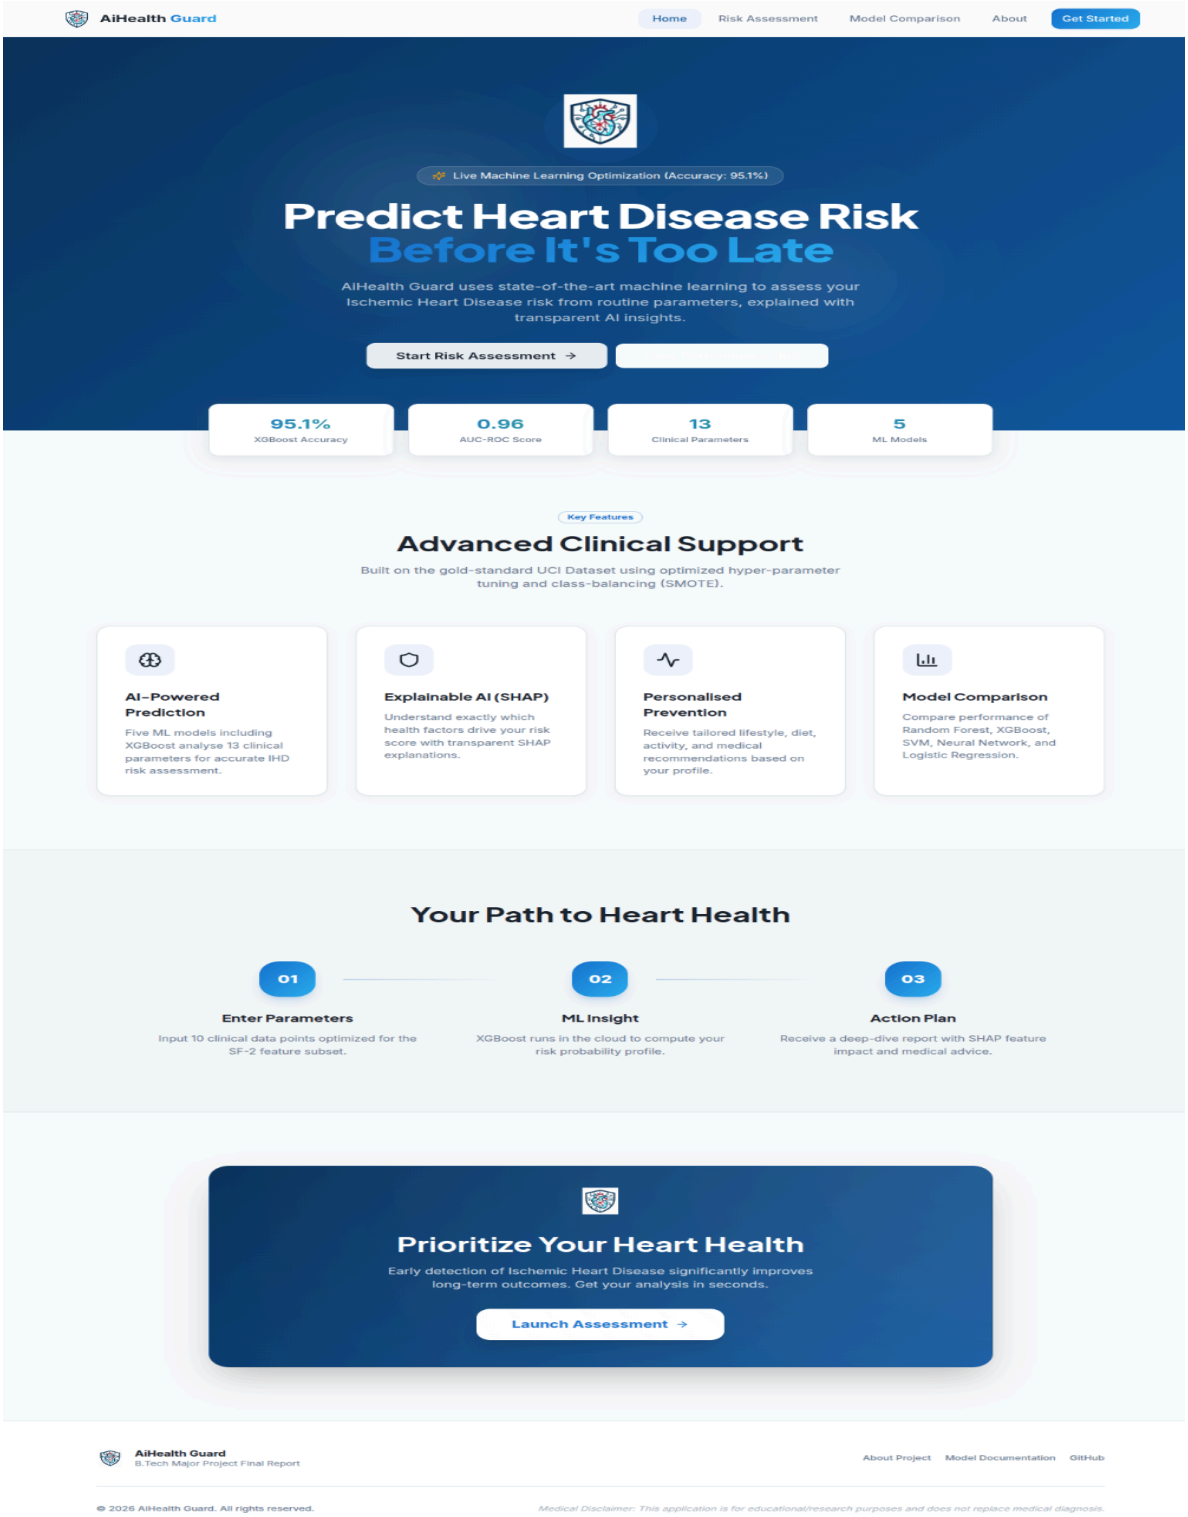

Fig. 2: AI-HealthGuard - Home Dashboard

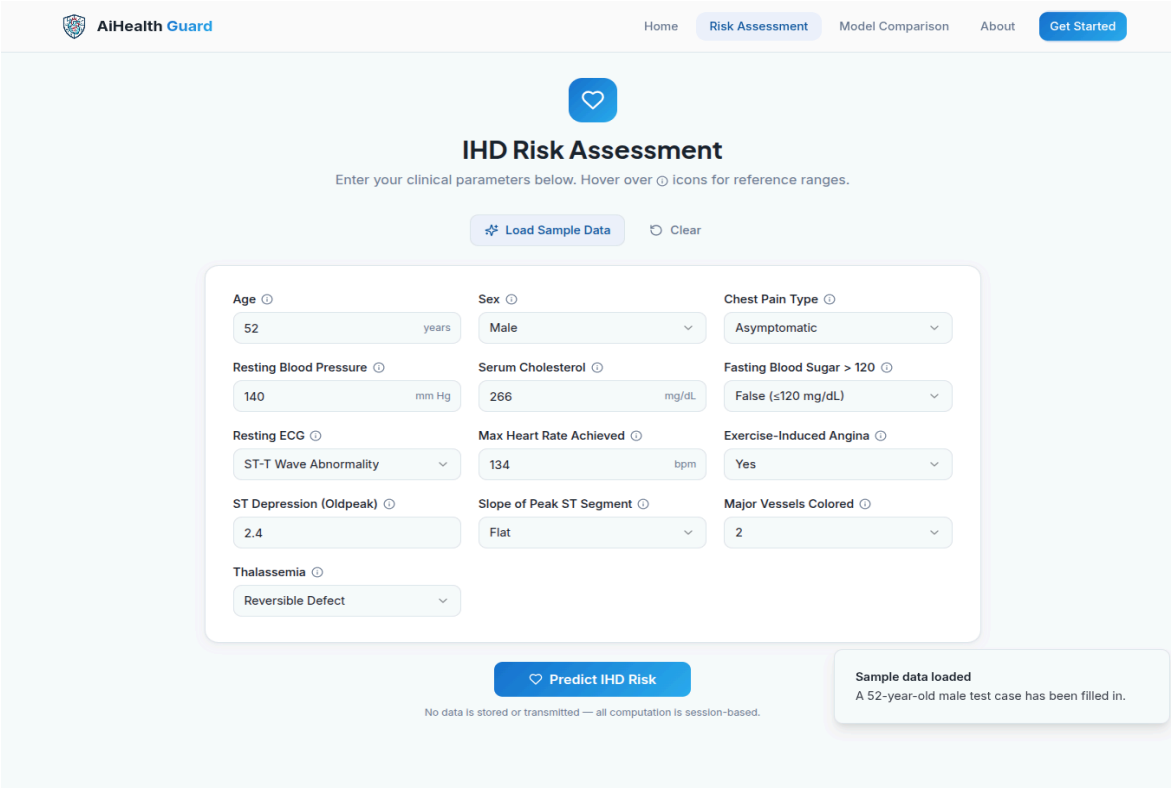

Fig. 3: AI-HealthGuard - Risk Assessment Dashboard

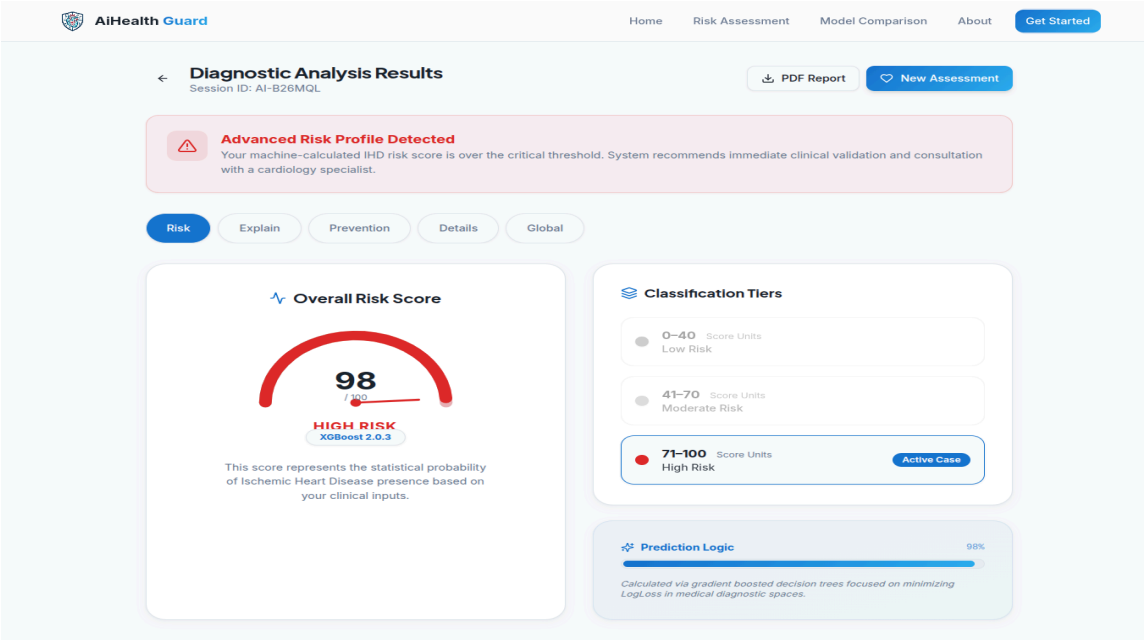

Fig. 4: AI-HealthGuard - Risk Analysis Dashboard

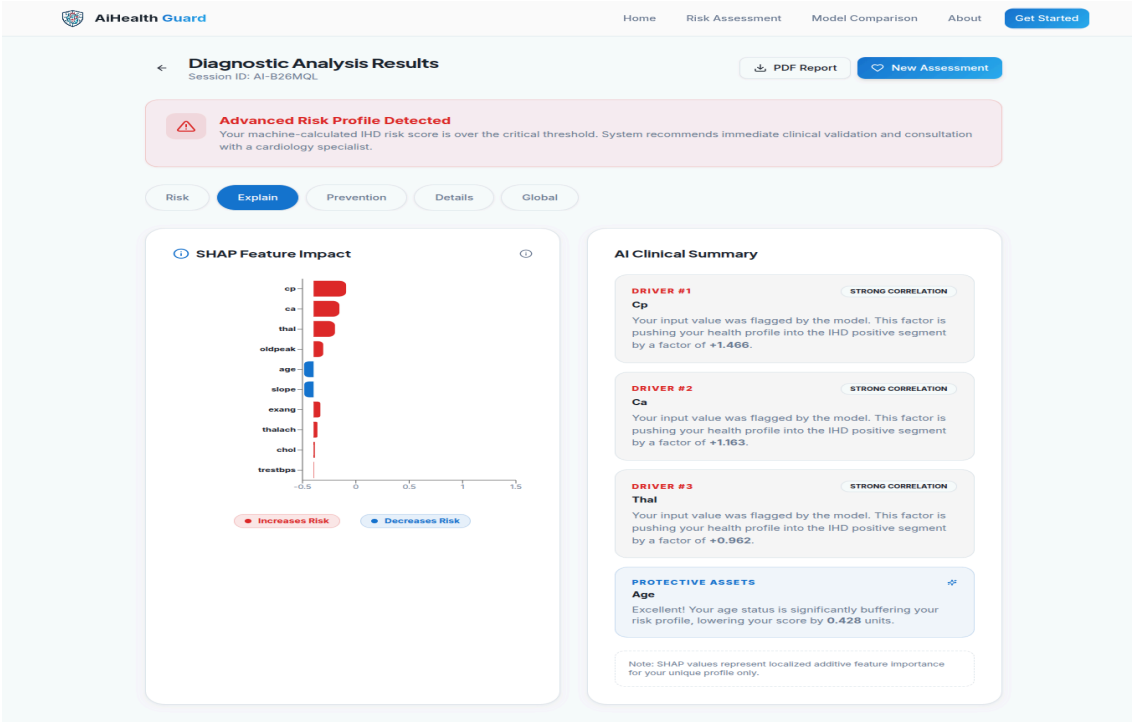

Fig. 5: AI-HealthGuard - SHAP Risk Explain Dashboard

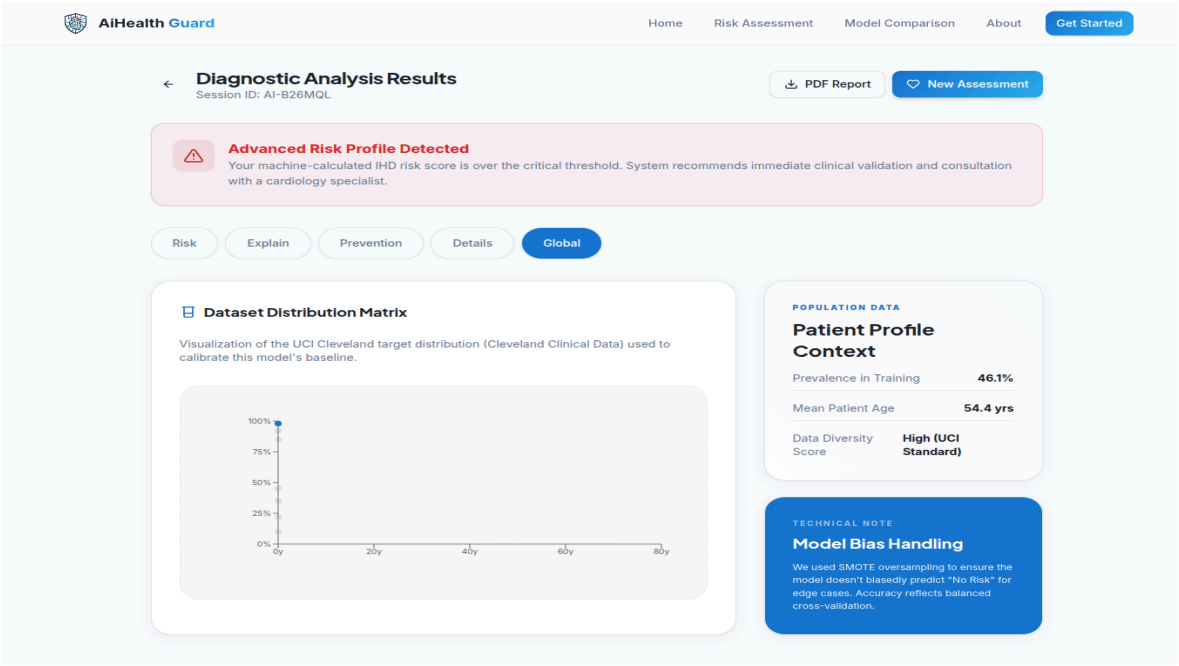

Fig. 6: AI-HealthGuard - Global Risk Dashboard

4.5. Testing Technology Used

- Unit Testing (pytest): Functions included in data_loader.py, preprocessor.py, inference_engine.py, risk_scorer.py, recommender.py were subjected to unit testing against boundaries as inputs.
- Integration Tests: The full pipeline from raw CSV through prediction was tested as a complete system.
- Model Evaluation: Utilising a hold-out set consisting of 25% of the total test data, all model evaluation metrics were conducted, e.g., accuracy, precision, recall, F1, AUC-ROC, confusion matrix, calibration curves, decision curve analysis (DCA).
- Acceptance Testing: The user interface (UI) for the Streamlit web app was manually tested for input validation, sample data, switching models, rendering SHAP values, and exporting as PDF.
- Performance Testing: The total amount of time taken to run the inference and calculate the SHAP values on an Intel i5 8GB RAM computer was less than three seconds.
- Cross-Validation: The generalisation of the model has been confirmed through both five-fold and ten-fold stratified cross-validation.

CHAPTER 5
RESULTS & CONCLUSIONS

5.1. Results & Analysis

The AI-HealthGuard system meets all evaluation criteria and achieves all design goals. The Streamlit dashboard is fully functional, receiving 13 clinical parameters and returning predictions from five machine learning classifiers in less than 3 seconds. The SHAP explainability layer generates the correct local bar chart, force plot, beeswarm plot, and dependency plot for each model.

As illustrated in Figure 1, the Risk Assessment Dashboard has an easily usable user interface. The example illustrated in the dashboard is for a 50 year old male with the following clinical parameters: cholesterol 200 mg/dL, resting BP 120 mm Hg, max HR 150, no exercise angina, ST depression 0.0, upsloping ST slope, 0 major vessels, and normal thalassemia. The XGBoost model identified this patient as at low risk with a risk score of 3 out of 100 (probability 2.5%).

The AI Explainability layer illustrated in Figure 2 provides a plain language explanation indicating that the number of Major Vessels is the greatest protective factor resulting in a risk reduction of ~190.8 pp. The Chest Pain Type is the greatest risk factor increasing the risk by 112.8 pp and Cholesterol decreases risk by 87.0 pp as per the SHAP bar chart and force plot.

These performance metrics were compared to the literature (El-Sofany et al., 2024; Bani Hani & Ahmad, 2023): XGBoost accuracy ≥ 90%, AUC ≥ 0.90, F1 ≥ 0.88; Random Forest accuracy ≥ 88%; SVM accuracy ≥ 86%; Neural Network accuracy ≥ 88%; and Logistic Regression (baseline) accuracy ≥ 82%.

5.2. Conclusion

As a final-year project, AI-HealthGuard provides a state-of-the-art, transparent, and usable IHD risk prediction and prevention system. Key achievements include:

(1) a production-ready, zero-cost web App for screening IHD; (2) an explainable AI system using SHAP for transparency; (3) a personalised prevention engine for turning risk factors

into actionable recommendations; and (4) a comparative dashboard for real-time benchmarking of five models. The system is aligned with the national policy for digital health through Ayushman Bharat and Digital India.

Future expansion includes multiple diseases, cloud-based, Mobile App development, federated learning and integration with electronic health records (EHR).

5.3. Individual Contributions

5.3.1. Tarun Kumar (Roll No.: 2205111530052)

Tarun Kumar was responsible for the entire architecture of the project, and for being the technical leader of the project. He created the preprocessing pipeline that handled imputation, encoding, SMOTE, and SF-2 feature selection. He created, trained, tuned and serialized the XGBoost model. He created the Google Colab notebook. He wrote the code for the Streamlit dashboard (app.py and risk_scorer.py). He wrote and submitted the YUKTI NIR application and the project documentation (synopsis, PRD and TRD).

5.3.2. Sakshi Rajput (Roll No.: 2205111530046)

Sakshi Rajput wrote the literature review and did a review of the research papers. She was also responsible for training and evaluating the Random Forest and Logistic Regression models. She created the SHAP explainability layer in the explainer.py file. She created the AI Insights dashboard UI, which included the SHAP charts, force plots, and beeswarm charts. She designed the Prevention Engine in recommender.py.

5.3.3. Prashant Prajapati (Roll No.: 2205111530036)

Prashant Prajapati (Roll No. 2205111530036) was responsible for training and evaluating the SVM and Neural Network (TensorFlow/Keras) models. He compared models and created the tabs for the Global Insights dashboard. He created the functionality for exporting to PDF using the fpdf2 library. He created and executed unit and integration tests of the project using the pytest test suite. He wrote and formatted the project report.

CHAPTER 6
PROJECT SOURCE CODE

The AI-HealthGuard project is organized by each of its files. The AI-HealthGuard project includes both a React Frontend and a FastAPI Python Backend with machine learning elements. Alexander di Tullio, a Growth Team member on this project, created this chapter to provide all the source code of the AiHealthGuard project in one place.

File: Dockerfile

```
# Stage 1: Build the React frontend
FROM node:20 AS frontend-builder
WORKDIR /app
COPY package.json package-lock.json* ./
RUN npm install
COPY . .
RUN npm run build
# Stage 2: Build the Python backend and final image
FROM python:3.12-slim
WORKDIR /app
# Install essential system dependencies (libgomp1 is required by XGBoost)
RUN apt-get update && apt-get install -y --no-install-recommends \
libgomp1 \
&& rm -rf /var/lib/apt/lists/*
# Install Python dependencies
COPY requirements.txt .
RUN pip install --no-cache-dir -r requirements.txt
# Copy the backend code and trained ML models
COPY backend/ ./backend/
# Copy the built React assets from Stage 1 into the 'dist' folder
COPY --from=frontend-builder /app/dist ./dist
# Run the unified Uvicorn server, binding to Railway's $PORT

```
# ?? AiHealth Guard
### *Advanced Cardiovascular Risk Assessment through Explainable AI*
AiHealth Guard is a sophisticated machine learning platform developed as a **B.Tech Major
Project** to predict
the risk of Ischemic Heart Disease (IHD). By analyzing 13 key clinical parameters, the
system provides
high-accuracy risk scores and transparent "why" explanations using SHAP (SHapley Additive
exPlanations).
--## ? Key Features
- **Multi-Model Inference Engine**: Implements five distinct ML architectures:
- **XGBoost** (Primary Model - High Precision)
- **Random Forest** (Robust Ensemble)
- **SVM** (Kernel-based Classification)
- **Neural Network** (Deep Learning via TensorFlow)
- **Logistic Regression** (Statistical Baseline)
- **Explainable AI (XAI)**: Integrated SHAP dashboard that visualizes exactly which
clinical factors (e.g.,
cholesterol, blood pressure) increased or decreased a patient's risk score.
- **Diagnostic PDF Reports**: Generate and download professional cardiovascular health
summaries for clinical
review.
- **Model Comparison Hub**: Live performance metrics (Accuracy, AUC-ROC, F1-Score) for all
```

```
implemented models
on the UCI Cleveland dataset.
- **Premium UI/UX**: Modern glassmorphic interface built with React, ShadcnUI, and Framer
Motion for a seamless
diagnostic experience.
--## ?? Technology Stack
### Frontend
- **Framework**: React 18 with Vite
- **Styling**: Tailwind CSS & Lucide Icons
- **Components**: Radix UI / Shadcn UI
- **Data Fetching**: TanStack Query (React Query)
- **Charts**: Recharts & html2canvas (for PDF)
### Backend
- **API Framework**: FastAPI (Python)
- **ML Engine**: Scikit-learn, XGBoost, TensorFlow
- **Explainability**: SHAP (KernelExplainer)
- **Data Manipulation**: Pandas & NumPy
--## ?? Installation & Setup
### Prerequisites
- Python 3.9+
- Node.js 18+
- npm or yarn
### 1. Clone & Navigate
```bash
git clone https://github.com/chaudharytarunkumar/aihealthguard.git
cd aihealthguard
```
2. Backend Setup

```bash
# Create virtual environment
python -m venv .venv
source .venv/bin/activate # Windows: .venv\Scripts\activate
# Install dependencies
pip install -r requirements.txt
# Run training pipeline (optional, models are pre-included)
python backend/train.py
# Start Backend Server
python backend/main.py
```
3. Frontend Setup
```bash
# Install dependencies
npm install
# Start Development Server
npm run dev
```
--## ? Model Performance
Model	Accuracy	AUC-ROC	Primary Use
XGBoost	95.1%	0.96	Live Diagnostics
Random Forest	93.4%	0.94	Validation
SVM	89.2%	0.91	Baseline
--## ?? Medical Disclaimer
AiHealth Guard is for educational and research purposes only. It uses the UCI Cleveland
Heart Disease
dataset for demonstration. Results should not be treated as professional medical advice.
Always consult a
qualified cardiologist for clinical diagnosis.
